Dnd Battlemap plan

Bjarke

I want to make a hexagonal grid battlemap with interchangeable background maps. The grid should be scalable to fit different map sizes.

I want to be able to seamlessly add more characters to the battlemap and have them also be selectable.

I want to have characters be selectable and be able to be moved around with mouse clicks and i want to track how far they move during their turn.
The selected character should have chess-like highlighted tiles for where they are now and where they were at the start of their turn.

Initiative should be quickly and easily applied to each character, and it should be displayed in an intuitive manner.

Your turn should end and move on to the next initiative when you click a big blue End Turn button.
There should be easily changeable names and health bars under each character. The health should either be edited with just typing, or keyboard inputs to reduce the health by 1 on arrow left or right, and 5 on arrow up or down. Hovering over a character should highlight the health and name, probably with font-weight: ;.

There should be a toggleable menu with drag-and-drop status effects that you can drop onto characters to have that status effect's icon appear above their heads.

There should be a toggleable menu with drag-and-drop characters, with one option for humanoids, monstrosities, automatons, bosses, player characters, allies, and so on.

You should always be able to mark tiles with right click, probably highlighting them in a transparent red. This should just be done with a classlist.toggle so you can right-click them again and have it go away. There should also be a button to toggle all of the selected tiles off at once.
